Universal Threat Management

Converging multiple security feature under single umbrella

At a Glance

Universal Threat Management (UTM) refers to a comprehensive approach to network security that combines multiple security features and functions into a single device or system. UTM solutions are designed to protect computer networks from a wide range of threats, including viruses, malware, spam, intrusion attempts, data breaches, and other malicious activities.

Key Features

- Anti-Spam
- Web Filtering
- Automatic Updates
- Content Filtering
- URL Whitelisting
- Data Loss Prevention (DLP)
- Centralized Integration & Management
- Advanced Threat Prevention (ATP)

Product Overview

UTM refers to when multiple security features or services are combined into a single device within your network. Using UTM, your network's users are protected with several different features, including content filtering, email and web filtering, URL whitelisting, anti-spam, and more.

UTM enables an organization to consolidate their IT security services into one place, potentially simplifying the protection of the network. As a result, your business can monitor all threats and security-related activity through a single pane of glass. In this way, you attain complete, simplified visibility into all elements of your security or wireless architecture.

The Garaj Advantage

Local Support	Managed Services	Dedicated Account Manager
Flexible Packages	Local Currency Billing	Cost Effective
